
Midyear Review: Stocks Maintain Momentum at Year's Halfway Point

Jun 26, 2024

KEY TAKEAWAYS

- US stocks extended a bull market, with the S&P 500 reaching a series of record highs in the year's first half, led by technology stocks.
- Core inflation fell slightly but remained above 3% in the US; the Fed kept rates steady, while central banks in Europe and Canada cut interest rates.
- Small cap and value stocks lagged the market, while high-profitability stocks outperformed, a reminder of the benefits of pursuing multiple premiums.

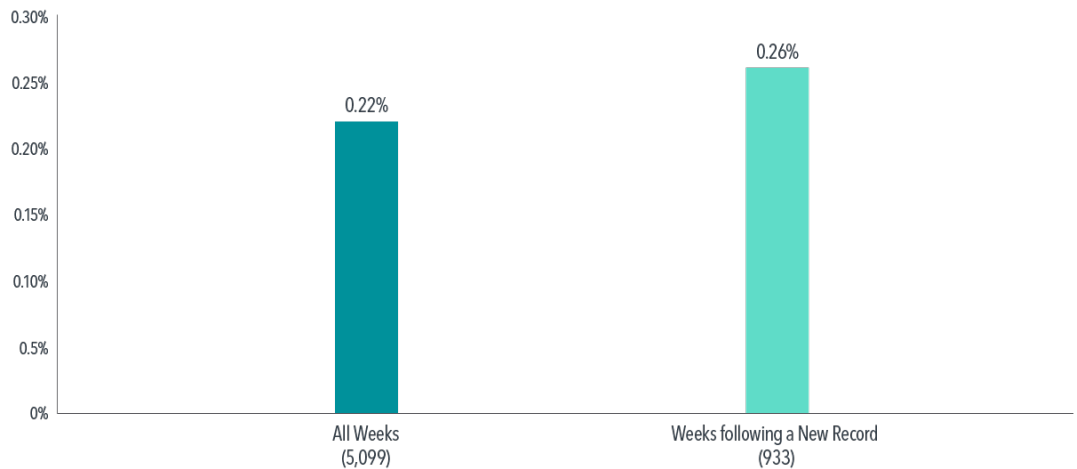

The beginning of 2024 started out a lot like the end of 2023, with markets rising amid talk of a potential decrease in US inflation and interest rate cuts from the Federal Reserve that could follow. But much like last year, those expectations remained unfulfilled, as core inflation fell slightly but held above 3% and the Fed stood pat on interest rates.¹ US stocks as measured by the S&P 500 rose to a series of record highs in the year's first half, and the benchmark 10-year US Treasury bond yield approached 5% in the spring before retreating.²

The Fed held a key measure, the federal funds rate, steady through June at 5.25%, the highest level in more than two decades, with officials citing an effort to cool persistently high inflation.³ Meanwhile, the European Central Bank cut rates for the first time since 2019, as did the Bank of Canada.⁴ US core inflation was 3.4% in May, a multiyear low but still well above the Fed's 2% target. However, it has moved in the direction policymakers have said they'd like to see it go—lower—though they indicated at their meeting in June that they expect just one rate cut before the end of the year.⁵

Against this backdrop, US stocks extended a bull market that began in late 2022, with the S&P 500 index gaining 14.6% through June 14 and notching new all-time highs. Record levels may lead some investors to wonder whether it's a good time to sell, but historical data can help allay such concerns. Periodic record setting should be expected for an asset class with positive expected returns. As Exhibit 1 shows, the average return for weeks following these new highs was 0.26%—very close to the average return of 0.22% across all weeks. As long as investors demand positive returns in exchange for holding stocks, a new market high doesn't mean the market is going to tumble.

Exhibit 1 Setting the Records Straight

Weekly returns for the Fama/French Total US Market Research Index, July 1926–March 2024

Past performance is no guarantee of future results. Indices are not available for direct investment.

The Dimensional and Fama/French indices represent academic concepts that may be used in portfolio construction and are not available for direct investment or for use as a benchmark. Index returns are not representative of actual portfolios and do not reflect costs and fees associated with an actual investment. See "Index Descriptions" for descriptions of the Dimensional and Fama/French index data.

The strong rally in the technology sector in 2023 continued into the new year. The tech-heavy Nasdaq, after gaining 44.6% last year, has risen 18.1% this year, vs. the S&P 500's 14.6% gain. Nvidia remained the biggest driver of gains in the tech sector through the end of May, as demand remained strong for chips used to power cutting-edge AI applications. But expecting Nvidia and the rest of the so-called Magnificent 7 tech stocks to outperform the broader market is to bet on them further exceeding the market's expectations. Simply meeting expectations may result in returns more in line with the market, consistent with the history of [top US stocks](#).

Global stock markets reached multiyear highs, with the MSCI All Country World Index rising 10.6% through mid-June.⁸ Developed international MSCI stocks, as represented by the MSCI World ex USA Index, added 4.4%, and emerging markets stocks, as represented by the MSCI Emerging Markets Index, were up 6.4%.

US Treasuries were little changed for the year, with the 10-year Treasury bond falling 1.0%. However, yields (which rise when prices fall) remained higher than they have been for most of the past decade. The 10-year Treasury yield touched 4.7% in April, after nearly reaching 5% last October for the first time since 2007, before pulling back to 4.2%

as of June 14.⁹

PUTTING PREMIUMS IN PERSPECTIVE

As the broader market gained, value stocks and the stocks of companies with small market capitalizations were unable to keep up with their historical outperformance. The MSCI All Country World Value Index rose 5.3%, about a third of the 15.7% increase for the MSCI All Country World Growth Index. Without help from the US tech sector, the MSCI All Country World ex USA Growth Index only rose 6.4%, still ahead of the 3.5% increase for the MSCI All Country World ex USA Value Index. Small cap companies underperformed large cap stocks globally: The MSCI All Country World Small Cap Index returned 1.3% vs. 10.6% for the larger-cap MSCI All Country World Index. But history suggests giving up on small cap value after prolonged stretches of underperformance in the past [would have been a mistake](#).

And premiums don't always move in lockstep, as stocks of companies with high profitability have recently outperformed the stocks of companies with low profitability. That has held true in both developed and emerging markets this year. The Fama/French Developed High Profitability Index rose 10.7% as of May 31, vs. 6.8% for its low-profitability counterpart. The Fama/French Emerging Markets High Profitability Index rose 5.4%, while its low-profitability counterpart rose 0.7% as of May 31. It's a reminder that investors who pursue multiple premiums can increase their chances of long-term success.

THE BENEFITS OF A FLEXIBLE APPROACH

Pursuing historical premiums is one way of seeking to outperform benchmark returns. Implementation—including portfolio design, daily management, and trading—is another. Every June, an event helps put this into focus. That's when Russell US indices undergo their "reconstitution," when the benchmarks add and drop stocks. As time goes by, however, stock prices will change; what was once a small cap might become a large cap. Revising holdings annually means those stocks are stuck in the index, regardless of their characteristics, until the following June.

As **Exhibit 2** shows, from December 2009 to May 2024, the small cap Russell 2000 Index had unsteady exposure to small caps. The percentage made up of large caps tended to rise through the year and peak before the index was reconstituted. That exposure to large caps came at the expense of a more consistent focus on small caps. In other words, investors may not have been getting what they came for. An investment process with the flexibility to evaluate and adjust holdings daily can provide a more consistent focus over time, potentially capturing premiums more reliably.

Exhibit 2**Sneak Peaks**

largest 1,000 stocks,
December 2009–May 2024

Investors who diversify, focus on the premiums, and embrace a flexible investing approach will still confront uncertainties in the year's second half. But **uncertainty is unavoidable**, and it accounts for the risk that can lead to positive returns. How long can the bull market endure, and which way will inflation, and interest rates, go? Will the surge for AI-associated companies continue? Will global hostilities in the Middle East and Ukraine ease or increase? Will the US election bring a big November stock swing? (Spoiler: **It usually hasn't.**) We'll find out eventually, by the time the answers are also incorporated in market prices. Until then, 2024—like every year—is a good one for having a long-term plan and sticking with it.

Results shown during periods prior to each index's inception date do not represent actual returns of the respective index. Other periods selected may have different results, including losses. Backtested index performance is hypothetical and is provided for informational purposes only to indicate historical performance had the index been calculated over the relevant time periods. Backtested performance results assume the reinvestment of dividends and capital gains. Profitability is measured as operating income before depreciation and amortization minus interest expense scaled by book. Eugene Fama and Ken French are members of the Board of Directors of the general partner of, and provide consulting services to, Dimensional Fund Advisors LP.

Fama/French Developed High Profitability Index: Provided by Fama/French from Bloomberg data. Includes stocks in the upper 30% operating profitability (OP) range in each region; companies weighted by float-adjusted market cap. Rebalanced annually in June. OP for June of year t is annual revenues minus cost of goods sold; interest expense; and selling, general, and administrative expenses, divided by book equity for the last fiscal year-end in $t - 1$.

Fama/French Emerging Markets High Profitability Index: July 1991–present: Fama/French Emerging Markets High Profitability Index. Courtesy of Fama/French from Bloomberg and IFC securities data. Includes stocks in the upper 30% operating profitability range in each country; companies weighted by float-adjusted market cap; rebalanced annually in June. OP for June of year t is annual revenues minus cost of goods sold; interest expense; and selling, general, and administrative expenses, divided by book equity for the last fiscal year-end in $t - 1$.

Expected premium: Represents the expected return difference between two investments. An expected return is the percentage increase in value a person may anticipate from an investment based on the level of risk associated with the investment, calculated as the mean value of the probability distribution of possible returns.

Profitability premium: The return difference between stocks of companies with high profitability vs. those with low profitability.

Size premium: The return difference between small capitalization stocks and large capitalization stocks.

Value premium: The return difference between stocks with low relative prices (value) and stocks with high relative prices (growth).

Value stock: A stock trading at a low price relative to a measure of fundamental value such as book equity.

Growth stock: A stock trading at a high price relative to a measure of fundamental value such as book equity.
